

How to Grow Diervilla

Position – Full sun or part shade
Soil – Well-drained
Flowering Time – Summer
Hardiness – Fully hardy

About Diervilla

Diervilla are deciduous shrubs with gorgeous veined foliage that will often adopt varying shades of green and red. Clusters of bright yellow flowers soon emerge during summer, displaying a beautiful contrast in colour. They are best grown in a woodland setting and their suckering habit can often stabilise banks and slopes. You can expect to see Diervilla grow to an approximate height and spread of 1 – 1.5 metres (3-5').

How to plant Diervilla

Diervilla are best planted in well-drained soil of loam, chalk, clay or sand within an acidic, alkaline or neutral PH balance, thriving in a position of full sun or part shade. Amend the planting area with plenty of grit to improve the drainage and water well once planted to settle the soil in place.

How to care for Diervilla

Prune Diervilla during late spring to remove any dead or dying wood and once again after the flowering period to maintain a neat and tidy appearance.

How to propagate Diervilla

It is possible to propagate Diervilla by softwood cuttings.
